

HERDA REPORT

SUSAN L. WATKINS
6068 S. STATE RD
HAMILTON, IN 46742

Case:	469
Date Received:	4/16/07
Report Date:	4/19/07

Horse: PURE DYNAMIC	Reg: 3387996
YOB: 1995 Breed: AQHA Sex: S	Alt. ID:
Sire: DYNAMIC DELUXE	Reg: 1690981
Dam: POCO UNIQUE FASHION	Reg: 2561823

HERDA Test Result

N/N

Result Codes:

- Hr/Hr Affected – Homozygous for HERDA (two copies of HERDA gene).
- N/Hr Carrier – Heterozygous (one normal gene copy and one HERDA gene copy).
- N/N Normal – Homozygous for the normal gene. Does not possess the disease-causing HERDA gene.

Hereditary Equine Regional Dermal Asthenia (HERDA) is inherited as a recessive trait. This means that breedings between two carrier (N/Hr) horses have a 25% chance of producing an affected foal (Hr/Hr). Affected foals generally appear normal at birth and may not show clinical signs of the disorder (fragile, excessively stretchy skin) until they reach one to two years of age. Foals produced by matings between carrier (N/Hr) and normal (N/N) horses always appear to be normal, but 50% of these are expected to be carriers. We therefore recommend DNA testing all offspring produced by carriers of this trait.
